MODEL 5000 SECTIONAL CUTAWAY

INLET/OUTLET SECTION CUTAWAY

PARALLEL CIRCUIT SPOOL SECTION CUTAWAY

UNIVERSAL OUTLET/ POWER BEYOND SECTION CUTAWAY

MODEL 5000

Since 1946, HUSCO International has established itself as the resource OEM engineers rely on for help designing high quality, innovative, customized products that meet precision motion control requirements. This catalog fully illustrates the component features and options you need to specify, build and service a Model 5000 sectional body directional control valve.

Designed for hydraulic systems, the Model 5000 valve line is made from an assortment of valve component sections and options that deliver the desired control valve circuit to match your specific application.

FEATURES

- 3000 psi operating pressure rating (207 bar)
- Open-center or closed-center operation
- Hard chrome plated spools
- Load check in each section
- Single “low pressure” O-ring sealing between sections
- Precision spool with metering notches

OPTIONS

- High pressure carryover (Power Beyond)
- Lock-out spool section (Built-in pilot operated check valve section)
- Mid-inlet flow combiner or separator
- Left-hand spool sections*
- Parallel, Conventional and Series circuitry
- End mechanisms:
 - Spring centered
 - Detent – single or multi-position
 - 4th position float
 - Hydraulic remote
 - Pneumatic remote
 - Automatic kick-out
- Auxiliary valves:
 - Pilot-operated, anti-cavitation check combination; relief cartridges
 - Anti-cavitation; cartridges
- Regenerative spools*
- Specialized spools*

* Consult HUSCO

MID-INLET COMBINER SECTION ASSEMBLY

MID-INLET PUMP FLOW COMBINES WITH UPSTREAM PUMP FLOW TO FEED DOWNSTREAM SPOOL SECTIONS. WHEN UPSTREAM SPOOL SECTIONS ARE ACTIVATED, DOWNSTREAM SPOOL SECTIONS ARE EXPOSED TO MID-INLET PUMP FLOW ONLY.

MID-INLET SECTIONS ARE USED IN-BETWEEN SPOOL SECTIONS EITHER TO ADD FLOW TO THE DOWNSTREAM SPOOL SECTIONS "COMBINER" OR TO INTRODUCE A "SEPARATE FLOW" CONDITION TO THE DOWNSTREAM SPOOL SECTIONS. MID-INLET SECTIONS ARE COUNTED AS A SPOOL SECTION WHEN DETERMINING TIE ROD KIT NUMBER.

5060-P RELIEF VALVE PERFORMANCE DATA

ABOUT THE 5060....

THE 5060 RELIEF VALVE IS THE WORKHORSE OF THE MODEL 5000 CONTROL VALVE LINE. THE 5060 IS USED AS A MAIN, CYLINDER PORT OR POWER BEYOND PRESSURE RELIEF VALVE. ITS HIGH FLOW PERFORMANCE CHARACTERISTICS AND ANTI-VOID CAPABILITIES MAKE IT THE UNIVERSAL CHOICE. THERE ARE OVER 2 MILLION 5060 RELIEFS IN OPERATION TODAY.

52710 RELIEF VALVE PERFORMANCE DATA

ABOUT THE 52710....

THE 52710 SERIES RELIEF IS A LOW COST, LOW FLOW, DIRECT ACTING RELIEF CARTRIDGE THAT FITS IN ALL THE AUXILIARY PORTS LISTED IN THIS CATALOG. IT IS USED EXTENSIVELY AS A CYLINDER PORT RELIEF WHEN A FULL FLOW RELIEF IS NOT NECESSARY. THIS RELIEF IS COMMONLY USED FOR ELIMINATING THE EFFECTS OF LOW FLOW PEAK PRESSURE SPIKES.

AUTOMATIC KICK-OUT FEATURE

The auto kick-out mechanism is designed to automatically release the spool to the center position at a pre-determined settable cylinder port pressure. The illustration below identifies the working components of the auto kick-out mechanism. The auto kick-out mechanism is not available in kit conv maintenance procedures.

AUTO KICK-OUT SETTING AND ADJUSTMENT

Adjustments to the auto kick-out valve section are made when integrated within a hydraulic circuit.

- 1. Install a press be adjusted.
- 2. With the hydraulic system off, shift auto kick-out valve section to a detented position.
- 3. Activate the to allow p the the pressure reading at time of kick-out; this will determine its current setting. Standard factory setting, if not specified, is 2000 PSI. . Note
- 4. To make adjustment above until desired setting is achieved. Adjustment range is 1000-2600 PSI. Run a few cycles to assure setting consistency, replace rubber plug. Note: Final main relief setting must be at least 250 PSI higher than the highest auto kick-out setting in the system.

Caution: To avoid damaged or lost parts do not remove adjustment screw.

HUSCO COMBINATION WORK PORT RELIEF AND ANTI-VOID UNIT

STEP 1

AS WORK PORT RELIEF

The relief valve is in communication between the high pressure port "HP" and low pressure "LP." Oil is admitted through the hole in poppet "C" and because of the differential area between diameters "A" and "B" relief valve poppet "D" and check valve poppet "K" are tightly seated as shown in the first step.

STEP 2

The oil pressure in the high pressure port "HP" has reached the setting of the pilot poppet spring force and unseats the pilot poppet "E." Oil flows around the poppet—through the cross drilled holes and to the low pressure area "LP."

STEP 3

The loss of oil behind Poppet "C," effected by the opening of pilot poppet "E," causes poppet "C" to move back and seat against pilot poppet "E." This shuts off the oil flow to the area behind relief valve poppet "D," and causes a low pressure area internally.

STEP 4

The imbalance of pressure on the inside, as compared to that of the high pressure port "HP," forces the relief valve poppet "D" to open and relieve the oil directly to the low pressure chamber "LP" in the valve.

AS ANTI-VOID

The anti-void unit supplies oil to the high pressure port "HP" when cavitation has occurred. A lower pressure exists in the port "HP" compared to the low pressure chamber "LP." The difference between the effective area of diameter "A" and "G" causes imbalance of the check valve poppet "K" which unseats, thus allowing oil from the low pressure chamber "LP" to enter the port "HP" and fill the void.

AS SEPARATE ANTI-VOID

The anti-void check valve opens when cavitation occurs in the high pressure port "HP" and supplies oil from the reservoir "LP" to help fill this void. The poppet "M" is held on its seat by the port pressure "HP," acting on the larger area behind the O-ring. When pressure "HP" drops below atmosphere, the tank pressure "LP" operating on the annular area A1-A2 will overcome the port pressure "HP" and the spring force to open the poppet. When the void is eliminated the spring will return the poppet which will then be tightly seated by the port pressure "HP."

Check HUSCO first for modern hydraulic/electrohydraulic components and systems engineered to your specific needs.

MAINTENANCE PROCEDURE

HUSCO COMBINATION WORK PORT RELIEF AND ANTI-VOID UNIT

There are several variations to the Work Port Relief. However all are similar in nature regarding service and repair.

HOW TO SET PRESSURE ON WORK PORT RELIEF

A good pressure gage must be installed in the line which is in communication with the work port relief. A load must be applied in a manner to reach the set pressure of the port relief unit. Then, follow these steps:

- Remove acorn nut and loosen lock nut
- Set adjusting screw to desired pressure setting
- Tighten lock nut and reassemble acorn nut
- Retest in similar manner as above

The Void Control Feature is not adjustable but is designed to operate whenever the work port pressure is lower than the reservoir pressure.

SERVICE AND REPAIR INFORMATION

The cartridge type work port reliefs used in the HUSCO valves are typically of the pilot poppet type with external adjustment. Any malfunctioning is usually the result of foreign matter lodging between the piston, relief valve poppet and check valve.

To perform service, clean the surrounding area and remove the complete relief valve cartridge. Examine the seat in the main valve housing and if grooves or ridges are present, the valve must be returned to HUSCO for re-machining.

The design of the pilot poppet and its seat provides positive seating and very seldom requires any maintenance. Therefore, the pilot section can be removed from the cartridge housing without disturbing the setting. With it will come the check valve poppet and other internal parts. These are easily disassembled and should be examined for foreign matter. All seats and seating surfaces should be smooth and free of nicks, scratches or grooves. Examine O-rings and backup washers for any damage and replace if necessary. All moving parts should slide freely, with only seal friction being present.

After inspecting and cleaning, immerse all parts in hydraulic oil and reassemble. Since pressure setting was not disturbed, unit can be tested for proper functioning under actual working conditions.

If operating difficulties indicate that the pilot poppet is leaking or sticking, remove internal parts of the pilot section and follow the same procedure as above, plus follow "How to Set Pressure" previously discussed.

If unit still does not function properly, you may wish to return the cartridge to HUSCO.

DIFFICULTY	PROBABLE CAUSE	REMEDY
Can't get Pressure	Poppet D, E or K stuck open or contamination under seat.	Check for foreign matter between poppets D, E or K and their mating parts. Parts must slide freely.
Erratic Pressure	Pilot poppet seat damaged. Poppet C sticking in D.	Replace the relief valve. Clean and remove surface marks for free movement.
Pressure setting not correct	Normal wear. Lock nut & adj. screw loose.	See "How to set pressure on work port relief."
Leaks	Damaged seats. Worn O-rings. Parts sticking due to contamination.	Replace the relief valve. Install seal and spring kit. Disassemble and clean.

TROUBLE SHOOTING – ANTI-VOID

Trouble resulting in malfunctioning can usually be traced to foreign matter plugging and sensing hole or preventing free movement of poppet. Also check seat for scratches, nicks or other marks.

SHUT-OFF VALVE

Shut-off valves are available to fit most work port and main relief valve machining locations.

ASSEMBLY PROCEDURES FOR THE HUSCO 5000 VALVE

1. Lay out valve components on a clean, flat working surface. The inlet assembly will include an O-ring, and the spool section(s) include an O-ring, a load check poppet and a load check spring. Tools required for basic valve assembly include 1/2" and 9/16" open or box end wrenches and a torque wrench with thin wall sockets.

2. Assemble tie rod nuts to one end of each tie rod with one or two threads showing. Insert tie rods through tie rod holes of inlet (larger tie rod at top). Lay inlet on end with tie rods up, place O-ring into position.

3. Place first spool section (O-ring side up) on inlet section, position O-ring and insert load check poppet (nose down) and spring (behind poppet) into load check cavity as shown. Repeat this procedure for each spool section; the load check springs are compressed by the following sections during assembly.

4. Position end section on last spool section as shown and hand tighten tie rod nuts. The end section is a "turn around" section without ports. Universal outlet/power beyond section and power beyond and closed center sections are also used as end sections. These end sections do not have O-ring grooves.

5. Position valve assembly with the mounting pads of the end sections on a flat surface. To obtain proper alignment of end sections relative to the spool sections, apply downward pressure to the end sections; snug tie rod nuts to about 10 ft-lb.

Final torque the two 1/2" nuts to 14 ft-lb; final torque the 9/16" nut to 33 ft-lb. Check for proper spool movement.

6. Install auxiliary valves and plugs and torque to proper specifications.

GENERAL ASSEMBLY NOTES:

- A. Lever assemblies can be installed on section before or after complete valve assembly.
- B. The load check and spring may be omitted from assembly in certain conditions (i.e., motor spools).

CONTROL FOCUSED - TECHNOLOGY DRIVEN

For over 50 years, HUSCO International has been designing and producing some of the most important custom hydraulic and electrohydraulic products in the construction, forestry and material handling industry. Today HUSCO control products can be found on a variety of leading off-highway equipment including: Caterpillar, CNH, Crown, Daewoo, Deere & Company, Hyundai, JCB, Jerr-Dan, JLG, Komatsu, Kubota, Liebherr, Manitowoc Crane Group, NACCO, Volvo, Terex, just to name a few.

Dedicated to meeting and exceeding the changing control needs of the off-highway market for today and well into tomorrow, HUSCO employs an extensive engineering staff capable of designing customized, cost-effective solutions to maximize the efficiency, productivity, controllability and reliability of vehicles.

And with vehicle fit-up and testing capabilities, we're able to design, install and test valve configurations at HUSCO facilities, reducing product development time while optimizing vehicle performance through iterative testing.

With manufacturing facilities in North America, Europe and Asia, we continue to expand as we work with international partners in South America, Korea, Japan, India, South Africa and Australia to bring you any product you need, anywhere in the world.
